

Can't install on my Win 7 64-bit

Posted by bshs95 - 25 Apr 2012 15:39

Hello.

Got a copy of DLR, but my computer won't install it.

The Red Orb-box where you can choose to install appears and when I press the "Install"-button nothing happens. When I try to start the Setup it says something about that it ain't compatible on my system. I have tried Program Compatibility troubleshooting, but it didn't work.

Please help.

I'm not good at computers so please describe it pretty simple.

I just really want to play this awesome game.

You could:

- Install it on an older computer and copy the directory

or better:

- Download a completely upgraded version from here: <http://lastcitadel.ru/Downloads.aspx>

In both cases: remember to start the game with a shortcut with the "wincursor" parameter (instructions in the link).

Feel free to ask again if you have problems.

Good luck!

Please tell me is that download version english?

Before 2 days i donwloaded a warlords DLR there was no need to install but the game was running in a language i couldn't read =(

Depa,

Yes, that link contains the English version of the game

KGB

I have installed it on a 32-bit computer. How exactley is it I have to do to get it from that computer to my own. I have tried and it won't play Singleplayer.

Please help.

I suggest you try the downloadable version.

To make single player work on your copied version you'll have to find the correct no-cd patch or edit the registry manually to play with cd. It will be simpler to download the game.

Oh, I had just forgot to take the CD from the 32-bit computer and into my own. Just a very stupid mistake, and it is now working perfect.

I am using the -WINCURSОР trick and I have changed the theme so it isn't an Aero-theme and running it with 256 colours and as Administrator.

Thanks for the help 🙏

EDIT: I know how stupid it was so there is no reason to write how stupid it was, because I KNOW.
